

• SOLANA • DEVNET BETA • SME FX PROTECTION

Kodrat.

[ko·drat] — destiny, the inevitable, the rate that does what it wants.

Bank-grade FX hedging for small exporters and importers.
Buy short-tenor currency protection from **USD 5,000** exposure.
No bank desk, no ISDA, no million-dollar minimum.

ANCHOR 1.0 · RFQ + SIGNED QUOTES · USDC CASH-SETTLED

GLOBAL TRADE / FX

USD 17.4K IDR

JPY cross FX

IDR SME hedge

[YOUR NAME / HANDLE]

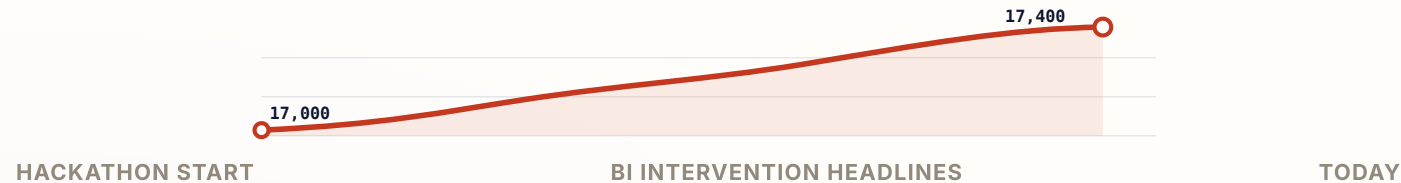

Invoices move globally.
Margins are local.

USDC-settled

USD/IDR moved from 17,000 to 17,400. For SMEs, that is *working-capital risk*.

Hackathon-week USD/IDR move:
17,000 → 17,400

RUPIAH SHENANIGANS

Wrong rate?

A viral Google glitch made USD/IDR look wildly mispriced while official references told a different story. That trust gap is exactly why SMEs need explicit protection, not vibes.

01 / Bank FX option · status quo

Built for treasury teams, not workshops.

- ✗ Minimum notional **USD 1M+**
- ✗ Corporate banking + ISDA agreement required
- ✗ Opaque pricing through relationship managers
- ✗ Slow settlement, paperwork, and high operational overhead

02 / Reality of an SME exporter

The invoice is global. The risk is personal.

- ✗ Average order ticket **USD 5K–50K**
- ✗ Payment arrives weeks after goods are shipped
- ✗ Margin is too thin to absorb a 3-8% currency move or a bad rate decision
- ✗ Result: **FX volatility becomes business risk**

Pick your exposure, pay a premium, get paid if FX moves *against you*.

Short-tenor FX options, quoted by market makers and cash-settled in USDC.

01 / Buyer

Hedge like a treasury, without becoming one.

Choose exporter or importer, pair, amount, and tenor. Kodrat translates the business problem into the right option and shows premium, strike, expiry, and payout scenarios.

→ User risk is limited to the premium paid.

02 / Market Maker

Quote risk off-chain, settle trustlessly.

MMs register through an **MmRegistry** PDA and sign RFQ quotes off-chain. The program verifies the signature before accepting a trade.

→ Day-1: one MM. v2: competitive marketplace.

03 / Settlement

Transparent collateral, automatic payout.

Premiums and collateral sit in an MM USDC vault. At expiry, anyone can settle; the program reads the price feed and pays intrinsic value to the buyer.

→ USDC payout offsets the FX loss.

Bu Ratna ships furniture from Jepara — and turns FX risk into a *known premium*.

Invoice **USD 5,000**, paid 60 days after shipment. Today USD/IDR is around **Rp 17,400**. If the rupiah snaps back to 16,500 before the invoice clears, she loses **Rp 4,500,000** on a margin that was already thin.

*Without hedging — potential loss of **Rp 4,500,000** if rupiah strengthens about 5%.*

*With Kodrat — buy a 60d put with a 17,400 strike, premium ~**USD 90**. Worst case: lose the premium. If the rate moves against her, receive a **USDC** payout that offsets the FX loss.*

0:00 — 0:15

Persona: Jepara furniture exporter sends a USD 5K invoice, paid in 60 days. Her cost base is rupiah

0:15 — 0:45

Opens Kodrat. Picks "Exporter" + USD 5K + 60d. The MM bot returns strike, premium, and scenario payout

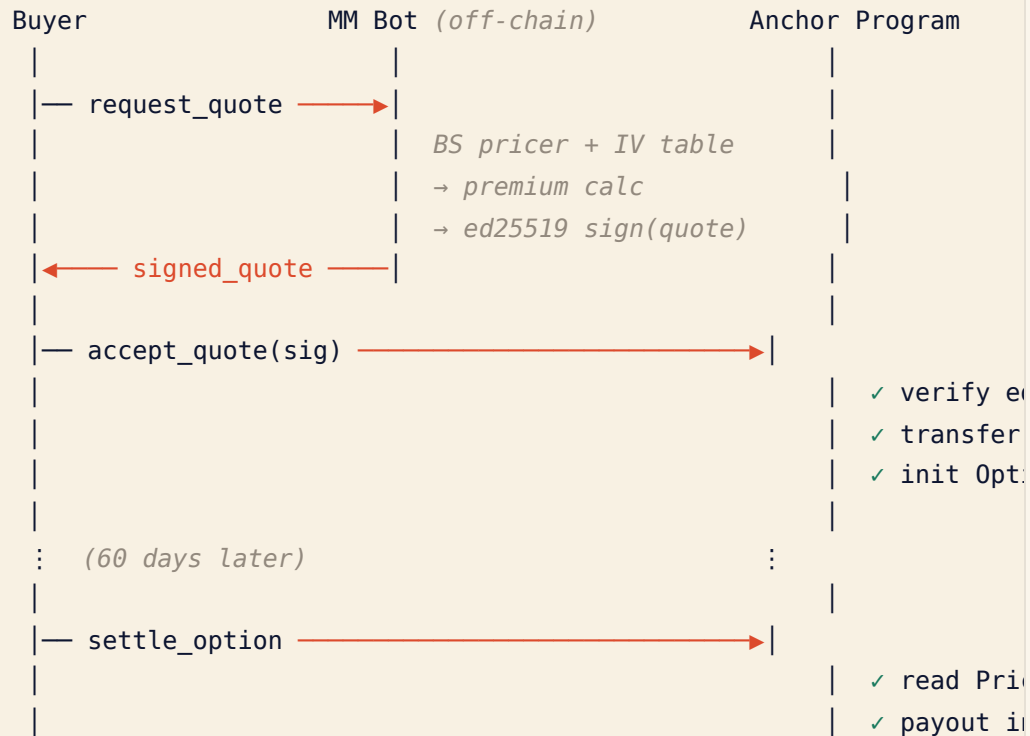

0:45 — 1:10

Accept the quote, sign the tx. Premium transferred, OptionPosition PDA created in < 2s

1:10 — 1:30

Skip 60 days. Rupiah snaps back. Anyone calls settle → USDC payout flows to Bu Ratna's wallet

The bot prices risk. The program enforces the deal and moves *USDC*.

Pricing & settlement

```
# Off-chain (MM bot)
premium = ATM_option(spot, tenor, iv)

# On-chain (settlement)
put = max(strike - spot, 0) × notional / strike
call = max(spot - strike, 0) × notional / strike
```

Stack

Program	Anchor 1.0 · Rust · 6 PDAs
MM bot	Rust · BS pricer · ed25519 sign
Oracle	Demo PriceFeed PDA · production: robust oracle
Frontend	Vanilla JS · Vite · /app RFQ flow
Demo mode	oracle staleness bypassed · disclosed in app

SME hedges only work when small tickets are economically *worth serving*.

Cost per settlement (open + close)

Solana **Kodrat** ~\$0.001

Ethereum L2 (Base) ~\$0.05

Ethereum L1 ~\$5–50

Bank wire (BCA) \$15 + 0.25%

For a USD 50 premium, high transaction fees erase the product. Low fees let the minimum ticket fall to real SME order sizes.

Why now

~18M

Crypto users in Indonesia have normalized wallet-based financial access.

Trust gap

The viral Google rate glitch showed how quickly bad FX information can move through WhatsApp and trading decisions.

64M

Indonesian SMEs face FX exposure without derivatives access.

Zero

Self-serve FX options for SME ticket sizes are still missing.

RFQ turns derivatives into a marketplace, not a balance-sheet *monopoly*.

Quote latency · end-to-end RFQ

Solana **Kodrat** ~1.2s

Ethereum L2 (Base) ~4–8s

Ethereum L1 ~30–60s

Options quotes expire quickly because spot and volatility move. Solana keeps quote acceptance inside the useful window.

Cost per accept / failed retry

Solana **Kodrat** \$0.001

Ethereum L2 (Base) \$0.05

Ethereum L1 \$5–50

Cheap retries allow tight spreads and a beginner-friendly UX: refresh quote, accept, settle, repeat.

400ms slot

Quote-to-confirm is fast → quote is still **fresh** when it lands.

ed25519 precompile

Verify signed quote on-chain in ~100 CU — **verification is nearly free**.

~50K TPS

Multiple MMs can compete on premium — the user gets a **market price**, not a bank quote.

Permissionless

Anyone registers as MM via the **MmRegistry** PDA — open marketplace by default.

Devnet product today. Mainnet path: oracle, margin, and *liquidity*.

[Your name]

SOLO FOUNDER · @HANDLE

[1 paragraph: your background — engineer? trader? quant? prior Solana / crypto work?]

Day-1 market maker: Rust pricer + ed25519 signer running off-chain, with a single-MM USDC vault on devnet today. The protocol already separates pricing from settlement so more MM's can join later.

Roadmap

- | | |
|-------------|---|
| MAY-JUN '26 | Mainnet alpha · USD/IDR puts · production oracle · single MM · external security review |
| JUL-SEP '26 | Multi-MM RFQ · best quote routing · capped calls · dynamic margin for MM vaults |
| Q4 '26 | Distribution · exporter associations · exchange/on-ramp partnerships · NDF integration for forward hedges |

Ask Superteam Indonesia

- 1 Design partners — SME exporters/importers willing to test hedging flows.
- 2 Market makers — liquidity partners for IDR, JPY, and CNY pairs.
